INDIAN DATA CLUB

# Day 9 (12/11): Date Functions

## 🎯 *Objective*

To understand and apply SQL **Date & Time functions** such as **DATEADD, DATEDIFF, and ISDATE**, perform **date arithmetic** for calculating or adjusting dates, and use the **EXTRACT** function to retrieve specific components (like year, month, or day) from date fields for effective time-based analysis.

## 🔍 *Topics Covered*

- **DATEADD()** – Adds a specified number of days, months, or years to a date.
- **DATEDIFF()** – Calculates the difference between two dates (in days, months, or years).
- **ISDATE()** – Checks whether a value is a valid date.
- **EXTRACT()** – Retrieves a specific part (like year, month, or day) from a date.
- **Date Arithmetic** – Performs calculations directly on date values (e.g., departure_date - arrival_date).

# ***DATE FUNCTIONS***

Date functions in SQL are used to **work with date and time values** — they help you **extract, calculate, add, or compare** dates to analyze time-based data easily.

## 🗓️ ***DATE FUNCTIONS (MySQL Workbench)***

**1. YEAR()** – Extracts the **year** from a date.
👉 **Syntax:** YEAR(date)
📄 *Example:* SELECT YEAR(arrival_date) FROM patients;

**2. MONTH()** – Extracts the **month number** (1–12) from a date.
👉 **Syntax:** MONTH(date)
📄 *Example:* SELECT MONTH(arrival_date) FROM patients;

**3. MONTHNAME()** – Returns the **name of the month** (e.g., January, February).
👉 **Syntax:** MONTHNAME(date)
📄 *Example:* SELECT MONTHNAME(arrival_date) FROM patients;

INDIAN DATA CLUB

## 📆 *DATE FUNCTIONS (MySQL Workbench)*

**4. DAY()** – Extracts the **day of the month** (1–31) from a date.
👉 **Syntax:** DAY(date)
📄 *Example:* SELECT DAY(arrival_date) FROM patients;

**5. DATEDIFF()** – Calculates the **difference (in days)** between two dates.
👉 **Syntax:** DATEDIFF(date1, date2)
📄 *Example:* SELECT DATEDIFF(departure_date, arrival_date) AS stay_duration FROM patients;

**6. DATE_ADD()** – Adds a specified **time interval** to a date.
👉 **Syntax:** DATE_ADD(date, INTERVAL value unit)
📄 *Example:* SELECT DATE_ADD(arrival_date, INTERVAL 7 DAY);

**7. DATE_SUB()** – Subtracts a specified **time interval** from a date.
👉 **Syntax:** DATE_SUB(date, INTERVAL value unit)
📄 *Example:* SELECT DATE_SUB(departure_date, INTERVAL 3 DAY);

INDIAN DATA CLUB

## 📆 ***DATE FUNCTIONS (MySQL Workbench)***

**8. CURDATE()** – Returns the **current date.**
👉 **Syntax:** CURDATE()
📄 *Example:* SELECT CURDATE();

**9. NOW()** – Returns the **current date and time.**
👉 **Syntax:** NOW()
📄 *Example:* SELECT NOW();

**10. EXTRACT()** – Extracts a **specific part** (like YEAR, MONTH, DAY) from a date.
👉 **Syntax:** EXTRACT(part FROM date)
📄 *Example:* SELECT EXTRACT(YEAR FROM arrival_date);

***(These are the most commonly used functions in reporting and analysis.)***

# Practice Questions:

```sql
-- Extract the year from all patient arrival dates.
SELECT
    YEAR(arrival_date) AS patient_arrival_year
FROM patients;
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: | Fetch rows:

| patient_arrival_year |
|---|
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |
| 2025 |

- **YEAR(arrival_date)** → extracts the year from each patient's arrival date.
- **AS patient_arrival_year** → renames the output column to patient_arrival_year.
- **FROM patients** → retrieves data from the patients table.

INDIAN DATA CLUB

# Practice Questions:

```
6   -- Calculate the length of stay for each patient (departure_date - arrival_date).
7 • SELECT
8       (departure_date - arrival_date) AS length_of_stay
9   FROM patients;
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: | Fetch rows:

| length_of_stay |
|---|
| 2 |
| 7 |
| 2 |
| 9 |
| 83 |
| 74 |
| 1 |
| 5 |
| 5 |
| 10 |
| 3 |
| 13 |
| 82 |
| 4 |
| 1 |

- **(departure_date - arrival_date)** → calculates the number of days each patient stayed.
- **AS length_of_stay** → renames the output column to length_of_stay.
- **FROM patients** → retrieves data from the patients table.

INDIAN DATA CLUB

# Practice Questions:

```sql
-- Find all patients who arrived in a specific month.
SELECT
    MONTHNAME(arrival_date) AS Month,
    COUNT(*) AS No_of_Patients_arrived
FROM patients
GROUP BY Month;
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

| Month | No_of_Patients_arrived |
|---|---|
| January | 85 |
| November | 83 |
| March | 75 |
| December | 74 |
| August | 88 |
| October | 92 |
| June | 81 |
| September | 94 |
| February | 80 |
| July | 82 |
| April | 81 |
| May | 85 |

- **MONTHNAME(arrival_date)** → extracts the month name from each patient's arrival date.
- **COUNT(*)** → counts the number of patients arrived in that month.
- **GROUP BY Month** → groups the records by month to get total patients per month.
- **FROM patients** → retrieves data from the patients table.

INDIAN DATA CLUB

# Daily Challenge:

```sql
-- Calculate the average length of stay (in days) for each service,
-- showing only services where the average stay is more than 7 days.
-- Also show the count of patients and order by average stay descending.
SELECT
    service,
    ROUND(AVG(DATEDIFF(departure_date, arrival_date)), 1) AS Avg_length_of_stay,
    COUNT(*) AS No_of_Patients
FROM patients
GROUP BY service
HAVING Avg_length_of_stay > 7
ORDER BY No_of_Patients DESC, Avg_length_of_stay DESC;
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

| service | Avg_length_of_stay | No_of_Patients |
|---|---|---|
| emergency | 7.2 | 263 |
| surgery | 7.9 | 254 |
| ICU | 7.6 | 241 |

- **DATEDIFF(departure_date, arrival_date)** → calculates the number of days between arrival and departure.
- **AVG(...)** → finds the average stay duration per service.
- **ROUND(...,2)** → rounds the average to 2 decimal places.
- **COUNT(*)** → counts patients in each service.
- **HAVING Avg_length_of_stay > 7** → shows only services with average stay above 7 days.
- **ORDER BY** → sorts results by number of patients and average stay in descending order.
